## Table of contents

Orientation of Radiation:

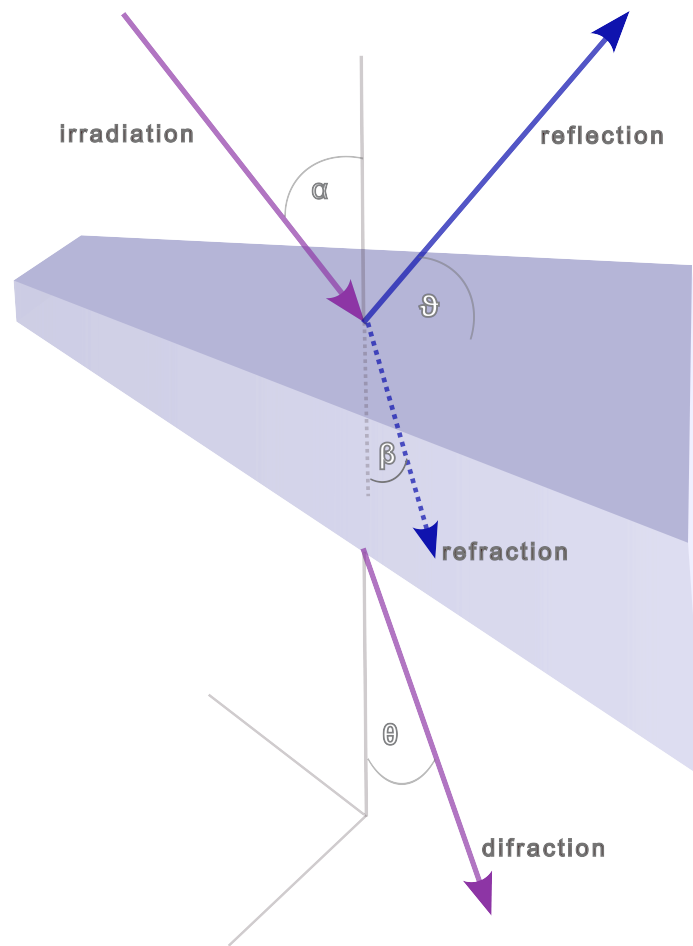

Figure 1: Radiation

$\vartheta$  = reflection angle for redirected radiation  $A_{r\parallel}$  parallel to  $\alpha$  from matter <sup>1</sup>

---

<sup>1</sup>Abstrahlwinkel zur Grenzfläche des Mediums

---

$\theta$  = diffraction angle for redirected radiation  $A_{r\perp}$  orthogonal to  $\alpha$  from matter <sup>2</sup>

$\varpi = \beta_1 + \beta_2$  = angle of converging body surfaces (point tip of prismic medium), spread angle of prism

$\varsigma$  = deviation angle of redirected ray beam after refraction (transmission) and diffraction

$u_g$  = aperture angle (acceptance) from sender source (at distance  $g$ )

$w_b$  = inclination angle at observer receiver (at distance  $b$ )

$\varepsilon$  = visual angle from observer/receiver (of eye)

---

<sup>2</sup>Beugungswinkel durch Objekt ins Vakuum
